CHAPTER ONE

GENERAL

The MLPotential engine in the Amsterdam Modeling Suite can calculate the potential energy surface using several different types of machine learning (ML) potentials. To use the ML potentials, you need to first separately [install them](#) (page 3).

The supported models can be found on the page [Models & Backends](#) (page 7).

1.1 Quickstart guide

To set up a simple MLPotential job using the graphical user interface, see the

- [ANI-1ccx Thermochemistry tutorial](#)
- [M3GNet tutorial](#)

1.2 What's new in AMS2024.1?

- New [models](#) (page 7): AIMNet2-B973c and AIMNet2-wB97MD3. These are suitable for molecular systems containing H, B, C, N, O, F, Si, P, S, Cl, As, Se, Br, I. These are currently the only ML potential models that support charged systems (ions), and that predict atomic charges and dipole moments and that give IR intensities when calculating normal modes.
- Train custom M3GNet models with [ParAMS](#) and [Simple Active Learning](#) (and use them in the MLPotential engine)
- [Auto detection](#) (page 13) of GPU.
- When using the ANI (or AIMNet2) models, the `mlpotential.txt` file is no longer produced but the engine uncertainty (standard deviation of committee prediction) is written to the standard output and stored on the binary `.rkf` results files.

1.3 What's new in AMS2023.1?

- New model: M3GNet-UP-2022 based on M3GNet. This is a universal potential (UP) that can be used for the entire periodic table of elements up to, but excluding, Curium (Cm, 96).
- New backend: M3GNet
- PiNN is no longer a backend in MLPotential, but you can use it through Engine ASE.

1.4 Theory of ML potentials

With machine learning potentials, it is possible to quickly evaluate the energies and forces in a system with close to first-principles accuracy. Machine learning potentials are fitted (trained, parameterized) to reproduce reference data, typically calculated using an ab initio or DFT method. Machine learning potentials are sometimes referred to as machine learning force fields, or as interatomic potentials based on machine learning.

Several types of machine learning potentials exist, for example neural-network-based methods and kernel-based methods.

Several types of **neural network potentials** exist. It is common for such potentials to calculate the total energy as a sum of atomic contributions. In a **high-dimensional neural network potential** (HDNNP), as proposed by Behler and Parrinello¹, each atomic contribution is calculated by means of a feed-forward neural network, that takes in a representation of the chemical environment around the atom as input. This representation, or atomic environment **descriptor** or **fingerprint**, consists of a vector of rotationally, translationally, and permutationally invariant functions known as **atom-centered symmetry functions** (ACSF).

Graph convolutional neural network potentials (GCNNPs), or **message-passing network neural potentials**, similarly construct the total energy by summing up atomic contribution, but the appropriate representations of local atomic chemical environments are learned from the reference data.

Kernel-based methods make predictions based on how similar a system is to the systems in the training set.

There are also other types of machine learning potentials. For more detailed information, see for example references² and³.

1.5 Support

SCM provides technical (non-scientific) support for installation and running simulations via the AMS driver.

See also: *Frequently Asked Questions* (page 21)

1.6 Technical information

Each of the supported backends can be used as **ASE** (Atomic Simulation Environment) calculators. The MLPotential engine is an interface to those ASE calculators. The communication between the AMS driver and the backends is implemented with a **named pipe interface**. The MLPotential engine launches a python script, `ase_calculators.py`, which initializes the ASE calculator. The exact command that is executed is written as `WorkerCommand` in the output.

INSTALLATION & UNINSTALLATION

Tip: If AMS does not support your preferred ML potential, you may be able to install it into the AMS Python environment yourself and use it through [engine ASE](#).

The Amsterdam Modeling Suite requires the installation of additional Python packages to run the machine learning potential backends.

If you set up an MLPotential job via the **graphical user interface**, you will be asked to install the packages if they have not been installed already when you save your input. You can also use the [package manager](#). A **command-line installation tool** can also be used, for instance to install the torchani backend:

```
"$AMSBIN"/amspackages install torchani
```

You can use the command line installer to install these packages on a remote system, so that you can seamlessly run MLPotential jobs also on [remote machines](#).

The packages are installed into the [AMS Python environment](#), and do not affect any other Python installation on the system. For the installation, an internet connection is required, unless you have configured the AMS package manager for [offline use](#).

To **uninstall** a package, e.g. `torchani`, run:

```
"$AMSBIN"/amspackages remove torchani
```

2.1 Installing GPU enabled backends using AMSpackages

New in version AMS2023.101.

Various versions of the ML potential packages are available through the AMSpackages, with different system dependencies such as GPU drivers. The option can be selected under the “ML options” menu in the graphical package manager (SCM -> Packages). You can choose from the following options,

- CPU, will install CPU-only backends, including PyTorch and Tensorflow-CPU.
- GPU (Cuda 11.6), will install GPU enabled backends, including Tensorflow, and a CUDA 11.6 specific version of pyTorch.
- GPU (Cuda 11.7), will install GPU enabled backends, including Tensorflow, but will include CUDA 11.7 enabled pyTorch instead.

The default is CPU. Note that this is the only option available under MacOS.

Using the package manager on the command line or in shell scripts you can use the `--alt` flag, together with one of the options. On the command line the options are denoted as `mlcpu`, `mlcu116` and `mlcu117` respectively. To install GPU enabled versions of the ML potential backends on the command line, for instance using the CUDA 11.7 enabled version of PyTorch:

```
$ "$AMSBIN"/amspackages --alt mlcu117 install mlpotentials
Going to install packages:
nvidia-cuda-runtime-cu11 v[11.7.99] - build:0
tensorflow v[2.9.1] - build:0
All ML Potential backends v[2.0.0] - build:0
torch v[1.13.1+cu117] - build:0
nvidia-cudnn-cu11 v[8.5.0.96] - build:0
M3GNet ML Backend v[0.2.4] - build:0
sGDMIL Calculator patch v[0.4.4] - build:0
TorchANI Calculator patch v[2.2] - build:0
SchNetPack ML Backend v[1.0.0] - build:0
nvidia-cuda-nvrtc-cu11 v[11.7.99] - build:0
nvidia-cublas-cu11 v[11.10.3.66] - build:0
ANI Models for TorchANI backend v[2.2] - build:0
TorchANI NN module patch v[2.2] - build:0
TorchANI ML backend v[2.2] - build:0
sGDMIL ML backend v[0.4.4] - build:0
```

Alternatively, to install a single backend for instance torchani:

```
"$AMSBIN"/amspackages --alt mlcu117 install torchani
```

To change the default value, you can set an environment variable `SCM_AMSPKGS_ALTERNATIVES`. For advanced configuration options of the package installation, see also the [package manager instructions](#).

2.2 Installing packages using pip

The package manager installs trusted and tested versions of packages from our website, but if you require a different version you can use pip to install packages from <https://pypi.org>:

```
"$AMSBIN"/amspython -m pip install -U torch
```

Note: Packages installed through pip alone by the user will not show up as installed in the package manager, but they will be detected and used if possible.

If you install a package into your amspython environment, using `amspython -m pip install`, the package manager will not display it in its overview. However, it will allow you to make use of it for running calculations with the ML Potential module. If you want to make sure that the version you installed will be detected, you can use

```
$ "$AMSBIN"/amspackages check --pip torch
05-11 10:47:57 torch is not installed!
05-11 10:47:57 User installed version located through pip: torch==1.8.1
```

Not all versions of the packages on PyPI work with our ML potential backends.

2.3 Installing NequIP using pip

NequIP (<https://github.com/mir-group/nequip>) is a popular equivariant machine learning potential, and is technically supported by the MLPotential engine. However, it cannot be installed through AMSpackages.

To install NequIP into the AMS Python environment, you may take the below instructions as a starting point. However, there is no guarantee that they will work for you on your system. SCM does not provide support for installing NequIP.

Tested with: AMS2024.101, Ubuntu Linux 22.04, February 13 2024

- To install NequIP, first install TorchANI through the package manager:

```
amspackages install torchani
```

- Next, install the NequIP package and related packages. Note that these versions are only a recommendation and might not work on every system.

```
amspython -m pip install nequip==0.5.5 --no-dependencies
amspython -m pip install e3nn==0.5.1 --no-dependencies
amspython -m pip install opt-einsum==3.3.0 --no-dependencies
amspython -m pip install opt-einsum-fx==0.1.4 --no-dependencies
amspython -m pip install sympy==1.11.1 --no-dependencies
amspython -m pip install mpmath==1.2.1 --no-dependencies
amspython -m pip install torch-runstats==0.2.0 --no-dependencies
amspython -m pip install scikit-learn==1.2.0 --no-dependencies
amspython -m pip install joblib==1.3.2 --no-dependencies
amspython -m pip install threadpoolctl==3.2.0 --no-dependencies
amspython -m pip install torch-ema==0.3 --no-dependencies
```

- For using the [Allegro plugin](https://github.com/mir-group/allegro) (<https://github.com/mir-group/allegro>) for NequIP (see \$AMSHOME/scripting/scm/params/examples/Allegro for an example) install the Allegro package from source (only python files):

```
cd <some place where it is convenient to instal programs>
git clone --depth 1 https://github.com/mir-group/allegro.git
cd allegro
amspython -m pip install . --no-dependencies
```

2.4 Debugging installation and available resources

A tool is provided to investigate the current installation of ML backends and frameworks. This tool will also report the resources that would be found by AMS if a calculation was performed with default settings.

The tool is used as follows:

```
$AMSBIN/amspython $AMSHOME/Utils/check_ml_backends.py
```

The following sections are part of the output:

- **Installed machine learning frameworks:** which frameworks are installed
- **Installed machine learning backends:** which backends are installed
- **Machine learning framework details:** details by the frameworks about CPU and GPU usage

Example output:

```
Installed machine learning frameworks:  
PyTorch    : installed!  
TensorFlow : installed!  
  
Installed machine learning backends:  
AIMNet2    : installed!  
ANI2       : installed!  
NequIP     : installed!  
M3GNet     : installed!  
  
Machine learning framework details (simulating an AMS calculation):  
  
#####PyTorch setup#####  
PyTorch 1.13.1+cpu found the following devices:  
Number of threads were not limited, using all available CPU cores.  
Using CPU only.  
#####  
  
#####TensorFlow setup#####  
TensorFlow 2.9.1-cpu found the following devices:  
PhysicalDevice(name='/physical_device:CPU:0', device_type='CPU')  
NumThreads was not specified in the MLPotential engine block, so TensorFlow will use  
→all available cores.  
#####
```

If there are any issues, before contacting [support](mailto:support@scm.com) (support@scm.com), please run the following command:

```
$AMSBIN/amspython $AMSHOME/Utils/check_ml_backends.py --debug
```

and then report the output with your question.

This will give us additional details on why a framework or backend was not considered installed and reports about potential issues in the environment.

MODELS & BACKENDS

3.1 Included (pre-parameterized) models

A **model** is the combination of a functional form with a set of parameters. Six pre-parameterized models can be selected: M3GNet-UP-2022 (Universal Potential), AIMNet2-B973c, AIMNet2-wB97MD3, ANI-2x, ANI-1ccx, and ANI-1x. The predictions from the AIMNet2-* and ANI-* models are calculated from **committees** (ensembles), meaning that the final prediction is an average over several independently trained neural networks.

Table 3.1: Pre-parameterized models for the MLPotential engine

	M3GNet-UP-2022	AIMNet2-B973c	AIMNet2-wB97MD3	ANI-2x	ANI-1ccx	ANI-1x
Type	Neural network	Neural network	Neural network	Neural network	Neural network	Neural network
Committee size	1	4	4	8	8	8
Atomic environment descriptor	m3gnet	AIMNet2	AIMNet2	ACSF	ACSF	ACSF
Supported elements	95: H, He, Li, ..., Am	H, B, C, N, O, F, Si, P, S, Cl, As, Se, Br, I	H, B, C, N, O, F, Si, P, S, Cl, As, Se, Br, I	H, C, N, O, F, S, Cl	H, C, N, O	H, C, N, O
Supports charged systems	No	Yes	Yes	No	No	No
Supports 3D periodicity	Yes	No	No	Yes	Yes	Yes
Predicts atomic charges	No	Yes	Yes	No	No	No
Predicts dipole moment	No	Yes	Yes	No	No	No
Predicts energy uncertainty	No	Yes	Yes	Yes	Yes	Yes
Predicts force uncertainty	No	Yes	Yes	Yes	Yes	Yes
Retrainable with ParAMS	Yes	No	No	No	No	No
Training set structures	materials project	molecules	molecules	organic molecules	organic molecules	organic molecules
Reference method	PBE, PBE+U	B97-3c	ωB97M-D3/Def2-TZVPP	ωB97-x/6-31G(d)	DLPNO-CCSD(T)/CBSx/6-31G(d)	ωB97-CCSD(T)/CBSx/6-31G(d)
Backend	m3gnet	AIMNet2	AIMNet2	TorchANI	TorchANI	TorchANI
Reference	¹	²	?	³	⁴	⁵

Note: Use the horizontal scrollbar in the above table to see all supported models.

Model

Type Multiple Choice

Default value ANI-2x

Options [Custom, AIMNet2-B973c, AIMNet2-wB97MD3, ANI-1ccx, ANI-1x, ANI-2x, M3GNet-UP-2022]

Description Select a particular parameterization.

¹ C. Chen, S. P. Ong. Nature Computational Science 2, 718–728 (2022). arXiv.2202.02450 (<https://doi.org/10.48550/arXiv.2202.02450>).

² D. M. Anstine, R. Zubatyuk, O. Isayev. <https://doi.org/10.26434/chemrxiv-2023-296ch>

³ C. Devereux et al., J. Chem. Theory Comput. 16 (2020) 4192–4202. <https://doi.org/10.1021/acs.jctc.0c00121>

⁴ J. S. Smith et al., Nat. Commun. 10 (2019) 2903. <https://doi.org/10.1038/s41467-019-10827-4>

⁵ J. S. Smith et al., J. Chem. Phys. 148 (2018) 241733. <https://doi.org/10.1063/1.5023802>

ANI-1x and ANI-2x: based on DFT (wB97X) ANI-1cxx: based on DLPNO-CCSD(T)/CBS M3GNet-UP-2022: based on DFT (PBE and PBE+U) data. AIMNet2: based on ω B97m-D3 or B97-3c data.

ANI-1x and ANI-1cxx have been parameterized to give good geometries, vibrational frequencies, and reaction energies for gasphase organic molecules containing H, C, O, and N. ANI-2x can also handle the atoms F, S, and Cl.

M3GNet-UP-2022 is a universal potential (UP) for the entire periodic table and has been primarily trained to crystal data (energies, forces, stresses) from the Materials Project.

AIMNet2 has been parametrized to give good geometries and reaction energies for gasphase molecules and ions containing H, B, C, N, O, F, Si, P, S, Cl, As, Se, Br, I.

Set to Custom to specify the backend and parameter files yourself.

3.2 Custom models (custom parameters)

Tip: You can use [Engine ASE](#) to use any ASE calculator as the engine.

Tip: You can use [ParAMS](#) to train your own ML potential parameters.

Set **Model** to **Custom** and specify which backend to use with the **Backend** option. In a typical case, you would have used that backend to train your own machine learning potential.

The backend reads the parameters, and any other necessary information (for example neural network architecture), from either a file or a directory. Specify the **ParameterFile** or **ParameterDir** option accordingly, with a path to the file or directory. Read the backend's documentation to find out which option is appropriate.

Some backends may require that an energy unit (**MLEnergyUnit**) and/or distance unit (**MLDistanceUnit**) be specified. These units correspond to the units used during the training of the machine learning potential.

Example:

```
Engine MLPotential
  Backend SchNetPack
  Model Custom
  ParameterFile ethanol.schnet-model
  MLEnergyUnit kcal/mol
  MLDistanceUnit angstrom
EndEngine
```

Backend

Type Multiple Choice

Options [M3GNet, NequIP, SchNetPack, sGML, TorchANI]

Description The machine learning potential backend.

MLDistanceUnit

Type Multiple Choice

Default value Auto

Options [Auto, angstrom, bohr]

GUI name Internal distance unit

Description Unit of distances expected by the ML backend (not the ASE calculator). The ASE calculator may require this information.

MLEnergyUnit

Type Multiple Choice

Default value Auto

Options [Auto, Hartree, eV, kcal/mol, kJ/mol]

GUI name Internal energy unit

Description Unit of energy output by the ML backend (not the unit output by the ASE calculator). The ASE calculator may require this information.

ParameterDir

Type String

Default value

GUI name Parameter directory

Description Path to a set of parameters for the backend, if it expects to read from a directory.

ParameterFile

Type String

Default value

Description Path to a set of parameters for the backend, if it expects to read from a file.

3.3 Backends

Table 3.2: Backends supported by the MLPotential engine.

	M3GNet	SchNetPack	sGML	TorchANI
Reference	⁸	⁸	⁹	¹⁰
Methods	m3gnet	HDNNPs, GCN-NPs, ...	GDML, sGML	[ensembles of] HDNNPs
Pre-built models	M3GNet-UP-2022	none	none	ANI-1x, ANI-2x, ANI-1ccx
Parameters from	ParameterDir	ParameterFile	ParameterFile	ParameterFile
Kernel-based	No	No	Yes	No
ML framework	TensorFlow 2.9.1	PyTorch	none, PyTorch	PyTorch

Note: Technically, there is also an AIMNet2 backend but it can only be activated through the pre-parametrized models AIMNet2-B973c and AIMNet2-wB97MD3.

⁸ K. T. Schütt et al., J. Chem. Theory Comput. 15 (2019) 448-455. <https://doi.org/10.1021/acs.jctc.8b00908>

⁹ S. Chmiela et al. Comp. Phys. Commun. 240 (2019) 38-45. <https://doi.org/10.1016/j.cpc.2019.02.007>

¹⁰ X. Gao et al. J. Chem. Inf. Model (2020). <https://doi.org/10.1021/acs.jcim.0c00451>

Note: Starting with AMS2023, PiNN⁷ is only supported as a custom Calculator through Engine ASE⁶.

Note: For sGML, the order of the atoms in the input file **must** match the order of atoms which was used during the fitting of the model.

Note: If you use a custom parameter file with TorchANI, the model specified via ParameterFile filename.pt is loaded with `torch.load('filename.pt')['model']`, such that a forward call should be accessible via `torch.load('filename.pt')['model']((species, coordinates))`. The energy shifter is not read from custom parameter files, so the absolute predicted energies will be shifted with respect to the reference data, but this does not affect relative energies (e.g., reaction energies).

⁶ <https://wiki.fysik.dtu.dk/ase/index.html>

CPU & GPU (CUDA), PARALLELIZATION

If the GPU-enabled versions of the backends have been *installed* (page 3), then by default the calculation will try to autodetect if there is a GPU available to run on, and if so use that. But you can also enforce to run on a specific Device.

To limit the number of CPU threads, the NumThreads keyword can be used if the backend uses PyTorch as its machine learning framework. Alternatively, you can set the environment variable OMP_NUM_THREADS.

To use a CUDA-enabled GPU, ensure that a CUDA-enabled version of TensorFlow or PyTorch has been installed (see *Installation & Uninstallation* (page 3)).

Device

Type Multiple Choice

Default value

Options [, cpu, cuda:0, cuda:1, mps]

Description Device on which to run the calculation (e.g. cpu, cuda:0).

If empty, the device can be controlled using environment variables for TensorFlow or PyTorch.

NumThreads

Type String

Default value

GUI name Number of threads

Description Number of threads.

If not empty, OMP_NUM_THREADS will be set to this number; for PyTorch-engines, torch.set_num_threads() will be called.

Note: Because the calculation runs in a separate process, the number of threads is controlled by the input keyword NumThreads and *not* by the environment variable NSCM. **We recommend setting NSCM=1** when using the MLPotential engine.

Only single-node calculations are currently supported.

AMS will report the compute resources it found for machine learning potentials in standard out after applying any restrictions from environment variables as well as NumThreads and Device.

GPU with PyTorch backend:

```
#####PyTorch setup#####
Number of threads were not limited, using all available CPU cores.
Using GPU: "cuda:0" as found by auto setup.

#####
```

GPU with TensorFlow backend:

```
#####TensorFlow setup#####
TensorFlow found the following devices:
PhysicalDevice(name='/physical_device:CPU:0', device_type='CPU')
PhysicalDevice(name='/physical_device:GPU:0', device_type='GPU')
NumThreads was not specified in the MLPotential engine block, so TensorFlow will use←
all available cores.
#####
```

CPU only with PyTorch backend:

```
#####PyTorch setup#####
Number of threads were not limited, using all available CPU cores.
Using CPU only.
#####
```

CPU only with TensorFlow backend:

```
#####TensorFlow setup#####
TensorFlow found the following devices:
PhysicalDevice(name='/physical_device:CPU:0', device_type='CPU')
NumThreads was not specified in the MLPotential engine block, so TensorFlow will use←
all available cores.
#####
```

EXAMPLES

Before running these examples, you need to [install](#) (page 3) the appropriate backend.

AMS DRIVER'S TASKS AND PROPERTIES

MLPotential is an [engine](#) used by the AMS driver. While the specific options for the MLPotential engine are described in this manual, the definition of the system, the selection of the task and certain (potential-energy-surface-related) properties are documented in the AMS driver's manual.

In this page you will find useful links to the relevant sections of the [AMS driver's Manual](#).

6.1 Geometry, System definition

The definition of the system, i.e. the atom types and atomic coordinates (and optionally, the lattice vectors and atomic masses for isotopes) are part of the AMS driver input. See the [System definition section of the AMS manual](#).

Note: The MLPotential Engine currently only supports 0D (molecules) and 3D (bulk) systems.

6.2 Tasks: exploring the PES

The job of the AMS driver is to handle all changes in the simulated system's geometry, e.g. during a geometry optimization or molecular dynamics calculation, using energy and forces calculated by the engine.

These are the tasks available in the AMS driver:

- [GCMC \(Grand Canonical Monte Carlo\)](#)
- [Geometry Optimization](#)
- [IRC \(Intrinsic Reaction Coordinate\)](#)
- [Molecular Dynamics](#)
- [NEB \(Nudged Elastic Band\)](#)
- [PESScan \(Potential Energy Surface Scan, including linear transit\)](#)
- [Single Point](#)
- [Transition State Search](#)
- [Vibrational Analysis](#)

6.3 Properties in the AMS driver

The following properties can be requested to the MLPotential engine in the AMS driver's input:

- Elastic tensor
- Hessian
- Nuclear gradients (forces)
- Normal modes
- PES point character
- Phonons
- Stress tensor
- Thermodynamic properties

FREQUENTLY ASKED QUESTIONS

7.1 General

7.1.1 Can I train my own ML Potentials?

Yes, see documentation pages for [ParAMS](#) and [Simple Active Learning](#).

7.1.2 Can I use implicit solvation (e.g., COSMO) with ML potentials?

No.

7.2 Errors and warning messages

7.2.1 Isolated atoms found in the structure

This message can appear with M3GNet when there are isolated atoms (atoms with no neighbors) in the structure. If this is what you expect then you can ignore the message.

The warning may also appear as “stderr: Isolated atoms found in the structure”.

7.2.2 sh: line 1: 1351 Illegal instruction: 4 sh

You may be attempting to run PyTorch on a rather old cpu. Make sure you have installed PyTorch and all other packages through the AMS package manager.

MLPOTENTIAL KEYWORDS

8.1 Engine MLPotential

Backend

Type Multiple Choice

Options [M3GNet, NequIP, SchNetPack, sGDML, TorchANI]

Description The machine learning potential backend.

Device

Type Multiple Choice

Default value

Options [, cpu, cuda:0, cuda:1, mps]

Description Device on which to run the calculation (e.g. cpu, cuda:0).

If empty, the device can be controlled using environment variables for TensorFlow or PyTorch.

MLDistanceUnit

Type Multiple Choice

Default value Auto

Options [Auto, angstrom, bohr]

GUI name Internal distance unit

Description Unit of distances expected by the ML backend (not the ASE calculator). The ASE calculator may require this information.

MLEnergyUnit

Type Multiple Choice

Default value Auto

Options [Auto, Hartree, eV, kcal/mol, kJ/mol]

GUI name Internal energy unit

Description Unit of energy output by the ML backend (not the unit output by the ASE calculator). The ASE calculator may require this information.

Model

Type Multiple Choice

Default value ANI-2x**Options** [Custom, AIMNet2-B973c, AIMNet2-wB97MD3, ANI-1ccx, ANI-1x, ANI-2x, M3GNet-UP-2022]**Description** Select a particular parameterization.

ANI-1x and ANI-2x: based on DFT (wB97X) ANI-1ccx: based on DLPNO-CCSD(T)/CBS
M3GNet-UP-2022: based on DFT (PBE and PBE+U) data. AIMNet2: based on ω B97m-D3 or B97-3c data.

ANI-1x and ANI-1ccx have been parameterized to give good geometries, vibrational frequencies, and reaction energies for gasphase organic molecules containing H, C, O, and N. ANI-2x can also handle the atoms F, S, and Cl.

M3GNet-UP-2022 is a universal potential (UP) for the entire periodic table and has been primarily trained to crystal data (energies, forces, stresses) from the Materials Project.

AIMNet2 has been parametrized to give good geometries and reaction energies for gasphase molecules and ions containing H, B, C, N, O, F, Si, P, S, Cl, As, Se, Br, I.

Set to Custom to specify the backend and parameter files yourself.

NumThreads**Type** String**Default value****GUI name** Number of threads**Description** Number of threads.

If not empty, OMP_NUM_THREADS will be set to this number; for PyTorch-engines, torch.set_num_threads() will be called.

ParameterDir**Type** String**Default value****GUI name** Parameter directory**Description** Path to a set of parameters for the backend, if it expects to read from a directory.**ParameterFile****Type** String**Default value****Description** Path to a set of parameters for the backend, if it expects to read from a file.

KF OUTPUT FILES

9.1 Accessing KF files

KF files are Direct Access binary files. KF stands for Keyed File: KF files are keyword oriented, which makes them easy to process by simple procedures. Internally all the data on KF files is organized into sections containing variables, so each datum on the file can be identified by the combination of section and variable.

All KF files can be opened using the [KFbrowser](#) GUI program:

```
$AMSBIN/kfbrowser path/to/ams.rkf
```

By default KFbrowser shows a just a curated summary of the results on the file, but you can make it show the raw section and variable structure by switching it to expert mode. To do this, click on **File → Expert Mode** or press **ctrl/cmd + e**.

KF files can be opened and read with [Command line tools](#).

For working with the data from KF files, it is often useful to be able to read them from Python. Using the [AMS Python Stack](#), this can easily be done with the [AKFReader](#) class:

```
>>> from scm.akfreader import AKFReader
>>> kf = AKFReader("path/to/ams.rkf")
>>> "Molecule%Coords" in kf
True
>>> kf.description("Molecule%Coords")
{
    '_type': 'float_array',
    '_shape': [3, 'nAtoms'],
    '_comment': 'Coordinates of the nuclei (x,y,z)',
    '_unit': 'Bohr'
}
>>> kf.read("Molecule%Coords")
array([[-11.7770694, -4.19739597, 0.04934546],
       [-9.37471321, -2.63234227, -0.13448698],
       ...
       [ 10.09508738, -1.06191208,  1.45286913],
       [ 10.11689333, -1.5080196, -1.87916127]])
```

Tip: For a full overview of the available methods in AKFReader, see the [AKFReader API](#) documentation.

9.2 Sections and variables on `mlpotential.rkf`

AMSRResults Section content: Generic results of the MLPotential evaluation.

AMSRResults%AtomicDipoleMoments

Type float_array

Description Atomic dipole moments computed by the engine.

Unit e*bohr

Shape [3, Molecule%nAtoms]

AMSRResults%BondInfo

Type subsection

Description FIXME: this section should include the file shared/ArchivedBondInfo.json, but there is a problem: the variable 'BondInfo.LatticeDisplacements@dim' ('Bond-Info.LatticeDisplacements@dim') is longer than 32 characters (the KF limit) and this messes up things. For now I'll just ignore all the variables in here...

AMSRResults%Bonds

Type subsection

Description Bond info

AMSRResults%Bonds%Atoms

Type archived_int_array

Description ?

AMSRResults%Bonds%CellShifts

Type archived_int_array

Description ?

AMSRResults%Bonds%description

Type string

Description A string containing a description of how the bond orders were calculated / where they come from

AMSRResults%Bonds%hasCellShifts

Type bool

Description Whether there are cell shifts (relevant only in case of periodic boundary conditions)

AMSRResults%Bonds%Index

Type archived_int_array

Description index(i) points to the first element of Atoms, Orders, and CellShifts belonging to bonds from atom 'i'. Index(1) is always 1, Index(nAtoms+1) is always nBonds + 1

AMSRResults%Bonds%Orders

Type archived_float_array

Description The bond orders.

AMSRResults%BulkModulus

Type float

Description The Bulk modulus (conversion factor from hartree/bohr³ to GPa: 29421.026)

Unit hartree/bohr³

AMSResults%Charges

Type float_array

Description Net atomic charges as computed by the engine (for example, the Charges for a water molecule might be [-0.6, 0.3, 0.3]). The method used to compute these atomic charges depends on the engine.

Unit e

Shape [Molecule%nAtoms]

AMSResults%DipoleGradients

Type float_array

Description Derivative of the dipole moment with respect to nuclear displacements.

Shape [3, 3, Molecule%nAtoms]

AMSResults%DipoleMoment

Type float_array

Description Dipole moment vector (x,y,z)

Unit e*bohr

Shape [3]

AMSResults%ElasticTensor

Type float_array

Description The elastic tensor in Voigt notation (6x6 matrix for 3D periodic systems, 3x3 matrix for 2D periodic systems, 1x1 matrix for 1D periodic systems).

Unit hartree/bohr^{nLatticeVectors}

Shape [:, :]

AMSResults%Energy

Type float

Description The energy computed by the engine.

Unit hartree

AMSResults%EnergyUncertainty

Type float

Description Uncertainty in the energy predicted by the engine. Exact meaning depends on the engine used.

Unit Hartree

AMSResults%Gradients

Type float_array

Description The nuclear gradients.

Unit hartree/bohr

Shape [3, Molecule%nAtoms]

AMSResults%GradientsMagnitudeUncertainty

Type float_array

Description Uncertainty in the magnitude of the gradients based on the variance formula (error propagation).

Unit Hartree/Bohr

Shape [Molecule%nAtoms]

AMSResults%GradientsUncertainty

Type float_array

Description Uncertainty in the nuclear gradients predicted by the engine. Exact meaning depends on the engine used.

Unit Hartree/Bohr

Shape [3, Molecule%nAtoms]

AMSResults%Hessian

Type float_array

Description The Hessian matrix

Unit hartree/bohr^2

Shape [3*Molecule%nAtoms, 3*Molecule%nAtoms]

AMSResults%Molecules

Type subsection

Description Molecules

AMSResults%Molecules%AtCount

Type archived_int_array

Description shape=(nMolType), Summary: number of atoms per formula.

AMSResults%Molecules%Atoms

Type archived_int_array

Description shape=(nAtoms), atoms(index(i):index(i+1)-1) = atom indices of molecule i

AMSResults%Molecules%Count

Type archived_int_array

Description Mol count per formula.

AMSResults%Molecules%Formulas

Type string

Description Summary: unique molecule formulas

AMSResults%Molecules%Index

Type archived_int_array

Description shape=(nMol+1), index(i) = index of the first atom of molecule i in array atoms(:)

AMSRResults%Molecules%Type**Type** archived_int_array**Description** shape=(nMol), type of the molecule, reference to the summary arrays below**AMSRResults%PESPointCharacter****Type** string**Description** The character of a PES point.**Possible values** ['local minimum', 'transition state', 'stationary point with >1 negative frequencies', 'non-stationary point']**AMSRResults%PoissonRatio****Type** float**Description** The Poisson ratio**AMSRResults%ShearModulus****Type** float**Description** The Shear modulus (conversion factor from hartree/bohr^3 to GPa: 29421.026)**Unit** hartree/bohr^3**AMSRResults%StressTensor****Type** float_array**Description** The clamped-ion stress tensor in Cartesian notation.**Unit** hartree/bohr^nLatticeVectors**Shape** [:, :]**AMSRResults%YoungModulus****Type** float**Description** The Young modulus (conversion factor from hartree/bohr^3 to GPa: 29421.026)**Unit** hartree/bohr^3**BZcell(primitive cell) Section content:** The Brillouin zone of the primitive cell.**BZcell(primitive cell)%boundaries****Type** float_array**Description** Normal vectors for the boundaries.**Shape** [ndim, nboundaries]**BZcell(primitive cell)%distances****Type** float_array**Description** Distance to the boundaries.**Shape** [nboundaries]**BZcell(primitive cell)%idVerticesPerBound****Type** int_array**Description** The indices of the vertices per bound.

Shape [nvertices, nboundaries]

BZcell(primitive cell)%latticeVectors

Type float_array

Description The lattice vectors.

Shape [3, :]

BZcell(primitive cell)%nboundaries

Type int

Description The nr. of boundaries for the cell.

BZcell(primitive cell)%ndim

Type int

Description The nr. of lattice vectors spanning the Wigner-Seitz cell.

BZcell(primitive cell)%numVerticesPerBound

Type int_array

Description The nr. of vertices per bound.

Shape [nboundaries]

BZcell(primitive cell)%nvertices

Type int

Description The nr. of vertices of the cell.

BZcell(primitive cell)%vertices

Type float_array

Description The vertices of the bounds.

Unit a.u.

Shape [ndim, nvertices]

DOS_Phonons **Section content:** Phonon Density of States

DOS_Phonons%DeltaE

Type float

Description The energy difference between sampled DOS energies. When there is no DOS at all a certain energy range can be skipped.

Unit hartree

DOS_Phonons%Energies

Type float_array

Description The energies at which the DOS is sampled.

Unit hartree

Shape [nEnergies]

DOS_Phonons%Fermi Energy

Type float

Description The fermi energy.

Unit hartree

DOS_Phonons%IntegrateDeltaE

Type bool

Description If enabled it means that the DOS is integrated over intervals of DeltaE. Sharp delta function like peaks cannot be missed this way.

DOS_Phonons%nEnergies

Type int

Description The nr. of energies to use to sample the DOS.

DOS_Phonons%nSpin

Type int

Description The number of spin components for the DOS.

Possible values [1, 2]

DOS_Phonons%Total DOS

Type float_array

Description The total DOS.

Shape [nEnergies, nSpin]

General Section content: General information about the MLPotential calculation.

General%account

Type string

Description Name of the account from the license

General%engine input

Type string

Description The text input of the engine.

General%engine messages

Type string

Description Message from the engine. In case the engine fails to solves, this may contains extra information on why.

General%file-ident

Type string

Description The file type identifier, e.g. RKF, RUNKF, TAPE21...

General%jobid

Type int

Description Unique identifier for the job.

General%program

Type string

Description The name of the program/engine that generated this kf file.

General%release

Type string

Description The version of the program that generated this kf file (including svn revision number and date).

General%termination status

Type string

Description The termination status. Possible values: ‘NORMAL TERMINATION’, ‘NORMAL TERMINATION with warnings’, ‘NORMAL TERMINATION with errors’, ‘ERROR’, ‘IN PROGRESS’.

General%title

Type string

Description Title of the calculation.

General%uid

Type string

Description SCM User ID

General%version

Type int

Description Version number?

KFDefinitions **Section content:** The definitions of the data on this file

KFDefinitions%json

Type string

Description The definitions of the data on this file in json.

kspac(primitive cell) **Section content:** should not be here!!!

kspac(primitive cell)%avec

Type float_array

Description The lattice stored as a 3xnLatticeVectors matrix. Only the ndimk,ndimk part has meaning.

Unit bohr

Shape [3, :]

kspac(primitive cell)%bvec

Type float_array

Description The inverse lattice stored as a 3x3 matrix. Only the ndimk,ndimk part has meaning.

Unit 1/bohr

Shape [ndim, ndim]

kspac(primitive cell)%kt

Type int

Description The total number of k-points used by the k-space to sample the unique wedge of the Brillouin zone.

```
kspace(primitive cell)%kunique
  Type int
  Description The number of symmetry unique k-points where an explicit diagonalization is needed.
    Smaller or equal to kt.

kspace(primitive cell)%ndim
  Type int
  Description The nr. of lattice vectors.

kspace(primitive cell)%ndimk
  Type int
  Description The nr. of dimensions used in the k-space integration.

kspace(primitive cell)%xyzpt
  Type float_array
  Description The coordinates of the k-points.
  Unit 1/bohr
  Shape [ndimk, kt]
```

Low Frequency Correction Section content: Configuration for the Head-Gordon Dampener-powered Free Rotor Interpolation.

```
Low Frequency Correction%Alpha
  Type float
  Description Exponent term for the Head-Gordon dampener.

Low Frequency Correction%Frequency
  Type float
  Description Frequency around which interpolation happens, in 1/cm.

Low Frequency Correction%Moment of Inertia
  Type float
  Description Used to make sure frequencies of less than ca. 1 1/cm don't overestimate entropy, in kg m^2.
```

Mobile Block Hessian Section content: Mobile Block Hessian.

```
Mobile Block Hessian%Coordinates Internal
  Type float_array
  Description ?

Mobile Block Hessian%Free Atom Indexes Input
  Type int_array
  Description ?

Mobile Block Hessian%Frequencies in atomic units
  Type float_array
  Description ?
```

```
Mobile Block Hessian%Frequencies in wavenumbers
    Type float_array
    Description ?

Mobile Block Hessian%Input Cartesian Normal Modes
    Type float_array
    Description ?

Mobile Block Hessian%Input Indexes of Block #
    Type int_array
    Description ?

Mobile Block Hessian%Intensities in km/mol
    Type float_array
    Description ?

Mobile Block Hessian%MBH Curvatures
    Type float_array
    Description ?

Mobile Block Hessian%Number of Blocks
    Type int
    Description Number of blocks.

Mobile Block Hessian%Sizes of Blocks
    Type int_array
    Description Sizes of the blocks.
    Shape [Number of Blocks]
```

Molecule Section content: The input molecule of the calculation.

```
Molecule%AtomicNumbers
    Type int_array
    Description Atomic number 'Z' of the atoms in the system
    Shape [nAtoms]

Molecule%AtomMasses
    Type float_array
    Description Masses of the atoms
    Unit a.u.
    Values range [0, '\infinity']
    Shape [nAtoms]

Molecule%AtomSymbols
    Type string
    Description The atom's symbols (e.g. 'C' for carbon)
```

Shape [nAtoms]

Molecule%bondOrders

Type float_array

Description The bond orders for the bonds in the system. The indices of the two atoms participating in the bond are defined in the arrays ‘fromAtoms’ and ‘toAtoms’. e.g. bondOrders[1]=2, fromAtoms[1]=4 and toAtoms[1]=7 means that there is a double bond between atom number 4 and atom number 7

Molecule%Charge

Type float

Description Net charge of the system

Unit e

Molecule%Coords

Type float_array

Description Coordinates of the nuclei (x,y,z)

Unit bohr

Shape [3, nAtoms]

Molecule%eeAttachTo

Type int_array

Description A multipole may be attached to an atom. This influences the energy gradient.

Molecule%eeChargeWidth

Type float

Description If charge broadening was used for external charges, this represents the width of the charge distribution.

Molecule%eeEField

Type float_array

Description The external homogeneous electric field.

Unit hartree/(e*bohr)

Shape [3]

Molecule%eeLatticeVectors

Type float_array

Description The lattice vectors used for the external point- or multipole- charges.

Unit bohr

Shape [3, eeNLatticeVectors]

Molecule%eeMulti

Type float_array

Description The values of the external point- or multipole- charges.

Unit a.u.

Shape [eeNZlm, eeNMulti]

Molecule%eeNLatticeVectors

Type int

Description The number of lattice vectors for the external point- or multipole- charges.

Molecule%eeNMulti

Type int

Description The number of external point- or multipole- charges.

Molecule%eeNZlm

Type int

Description When external point- or multipole- charges are used, this represents the number of spherical harmonic components. E.g. if only point charges were used, eeNZlm=1 (s-component only). If point charges and dipole moments were used, eeNZlm=4 (s, px, py and pz).

Molecule%eeUseChargeBroadening

Type bool

Description Whether or not the external charges are point-like or broadened.

Molecule%eeXYZ

Type float_array

Description The position of the external point- or multipole- charges.

Unit bohr

Shape [3, eeNMulti]

Molecule%EngineAtomicInfo

Type string_fixed_length

Description Atom-wise info possibly used by the engine.

Molecule%fromAtoms

Type int_array

Description Index of the first atom in a bond. See the bondOrders array

Molecule%latticeDisplacements

Type int_array

Description The integer lattice translations for the bonds defined in the variables bondOrders, fromAtoms and toAtoms.

Molecule%LatticeVectors

Type float_array

Description Lattice vectors

Unit bohr

Shape [3, nLatticeVectors]

Molecule%nAtoms

Type int

Description The number of atoms in the system

Molecule%nAtomsTypes

Type int

Description The number different of atoms types

Molecule%nLatticeVectors

Type int

Description Number of lattice vectors (i.e. number of periodic boundary conditions)

Possible values [0, 1, 2, 3]

Molecule%toAtoms

Type int_array

Description Index of the second atom in a bond. See the bondOrders array

MoleculeSuperCell Section content: The system used for the numerical phonon super cell calculation.

MoleculeSuperCell%AtomicNumbers

Type int_array

Description Atomic number ‘Z’ of the atoms in the system

Shape [nAtoms]

MoleculeSuperCell%AtomMasses

Type float_array

Description Masses of the atoms

Unit a.u.

Values range [0, ‘infinity’]

Shape [nAtoms]

MoleculeSuperCell%AtomSymbols

Type string

Description The atom’s symbols (e.g. ‘C’ for carbon)

Shape [nAtoms]

MoleculeSuperCell%bondOrders

Type float_array

Description The bond orders for the bonds in the system. The indices of the two atoms participating in the bond are defined in the arrays ‘fromAtoms’ and ‘toAtoms’. e.g. bondOrders[1]=2, fromAtoms[1]=4 and toAtoms[1]=7 means that there is a double bond between atom number 4 and atom number 7

MoleculeSuperCell%Charge

Type float

Description Net charge of the system

Unit e

MoleculeSuperCell%Coords

Type float_array

Description Coordinates of the nuclei (x,y,z)

Unit bohr

Shape [3, nAtoms]

MoleculeSuperCell%eeAttachTo

Type int_array

Description A multipole may be attached to an atom. This influences the energy gradient.

MoleculeSuperCell%eeChargeWidth

Type float

Description If charge broadening was used for external charges, this represents the width of the charge distribution.

MoleculeSuperCell%eeEField

Type float_array

Description The external homogeneous electric field.

Unit hartree/(e*bohr)

Shape [3]

MoleculeSuperCell%eeLatticeVectors

Type float_array

Description The lattice vectors used for the external point- or multipole- charges.

Unit bohr

Shape [3, eeNLatticeVectors]

MoleculeSuperCell%eeMulti

Type float_array

Description The values of the external point- or multipole- charges.

Unit a.u.

Shape [eeNZlm, eeNMult]

MoleculeSuperCell%eeNLatticeVectors

Type int

Description The number of lattice vectors for the external point- or multipole- charges.

MoleculeSuperCell%eeNMult

Type int

Description The number of external point- or multipole- charges.

MoleculeSuperCell%eeNZlm

Type int

Description When external point- or multipole- charges are used, this represents the number of spherical harmonic components. E.g. if only point charges were used, eeNZlm=1 (s-component only). If point charges and dipole moments were used, eeNZlm=4 (s, px, py and pz).

Other Section content: Contains any information send over by ASE/python which AMS does not know how to handle.
This is stored but not documented.

phonon_curves Section content: Phonon dispersion curves.

phonon_curves%brav_type

Type string

Description Type of the lattice.

phonon_curves%Edge_#_bands

Type float_array

Description The band energies

Shape [nBands, nSpin, :]

phonon_curves%Edge_#_direction

Type float_array

Description Direction vector.

Shape [nDimK]

phonon_curves%Edge_#_kPoints

Type float_array

Description Coordinates for points along the edge.

Shape [nDimK, :]

phonon_curves%Edge_#_labels

Type lchar_string_array

Description Labels for begin and end point of the edge.

Shape [2]

phonon_curves%Edge_#_1Gamma

Type bool

Description Is gamma point?

phonon_curves%Edge_#_nKPoints

Type int

Description The nr. of k points along the edge.

phonon_curves%Edge_#_vertices

Type float_array

Description Begin and end point of the edge.

Shape [nDimK, 2]

phonon_curves%Edge_#_xFor1DPlotting

Type float_array

Description x Coordinate for points along the edge.

Shape [:]

phonon_curves%indexLowestBand
Type int
Description ?

phonon_curves%nBands
Type int
Description Number of bands.

phonon_curves%nBas
Type int
Description Number of basis functions.

phonon_curves%nDimK
Type int
Description Dimension of the reciprocal space.

phonon_curves%nEdges
Type int
Description The number of edges. An edge is a line-segment through k-space. It has a begin and end point and possibly points in between.

phonon_curves%nEdgesInPath
Type int
Description A path is built up from a number of edges.

phonon_curves%nSpin
Type int
Description Number of spin components.
Possible values [1, 2]

phonon_curves%path
Type int_array
Description If the (edge) index is negative it means that the vertices of the edge abs(index) are swapped e.g. path = (1,2,3,0,-3,-2,-1) goes through edges 1,2,3, then there's a jump, and then it goes back.
Shape [nEdgesInPath]

phonon_curves%path_type
Type string
Description ?

Phonons Section content: Information on the numerical phonons (super cell) setup. NB: the reciprocal cell of the super cell is smaller than the reciprocal primitive cell.

Phonons%Modes
Type float_array
Description The normal modes with the translational symmetry of the super cell.

Shape [3, nAtoms, 3, NumAtomsPrim, nK]

Phonons%nAtoms

Type int

Description Number of atoms in the super cell.

Phonons%nK

Type int

Description Number of gamma-points (of the super cell) that fit into the primitive reciprocal cell.

Phonons%NumAtomsPrim

Type int

Description Number of atoms in the primitive cell.

Phonons%xyzKSuper

Type float_array

Description The coordinates of the gamma points that fit into the primitive reciprocal cell.

Shape [3, nK]

Thermodynamics Section content: Thermodynamic properties computed from normal modes.

Thermodynamics%Enthalpy

Type float_array

Description Enthalpy.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Entropy rotational

Type float_array

Description Rotational contribution to the entropy.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Entropy total

Type float_array

Description Total entropy.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Entropy translational

Type float_array

Description Translational contribution to the entropy.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Entropy vibrational

Type float_array

Description Vibrational contribution to the entropy.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Gibbs free Energy

Type float_array

Description Gibbs free energy.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Heat Capacity rotational

Type float_array

Description Rotational contribution to the heat capacity.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Heat Capacity total

Type float_array

Description Total heat capacity.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Heat Capacity translational

Type float_array

Description Translational contribution to the heat capacity.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Heat Capacity vibrational

Type float_array

Description Vibrational contribution to the heat capacity.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Inertia direction vectors

Type float_array

Description Inertia direction vectors.

Shape [3, 3]

Thermodynamics%Internal Energy rotational

Type float_array

Description Rotational contribution to the internal energy.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Internal Energy total

Type float_array

Description Total internal energy.

Unit a.u.

Thermodynamics%Internal Energy translational

Type float_array

Description Translational contribution to the internal energy.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Internal Energy vibrational

Type float_array

Description Vibrational contribution to the internal energy.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%lowFreqEntropy

Type float_array

Description Entropy contributions from low frequencies (see ‘lowFrequencies’).

Unit a.u.

Shape [nLowFrequencies]

Thermodynamics%lowFreqHeatCapacity

Type float_array

Description Heat capacity contributions from low frequencies (see ‘lowFrequencies’).

Unit a.u.

Shape [nLowFrequencies]

Thermodynamics%lowFreqInternalEnergy

Type float_array

Description Internal energy contributions from low frequencies (see ‘lowFrequencies’).

Unit a.u.

Shape [nLowFrequencies]

Thermodynamics%lowFrequencies

Type float_array

Description Frequencies below 20 cm⁻¹ (contributions from frequencies below 20 cm⁻¹ are not included in vibrational sums, and are saved separately to ‘lowFreqEntropy’, ‘lowFreqInternalEnergy’ and ‘lowFreqInternalEnergy’). Note: this does not apply to RRHO-corrected quantities.

Unit cm⁻¹

Shape [nLowFrequencies]

Thermodynamics%Moments of inertia

Type float_array

Description Moments of inertia.

Unit a.u.

Shape [3]

Thermodynamics%nLowFrequencies

Type int

Description Number of elements in the array lowFrequencies.

Thermodynamics%nTemperatures

Type int

Description Number of temperatures.

Thermodynamics%Pressure

Type float

Description Pressure used.

Unit atm

Thermodynamics%RRHOCorrectedHeatCapacity

Type float_array

Description Heat capacity T*S corrected using the ‘low vibrational frequency free rotor interpolation corrections’.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%RRHOCorrectedInternalEnergy

Type float_array

Description Internal energy T*S corrected using the ‘low vibrational frequency free rotor interpolation corrections’.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%RRHOCorrectedTS

Type float_array

Description T*S corrected using the ‘low vibrational frequency free rotor interpolation corrections’.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%Temperature

Type float_array

Description List of temperatures at which properties are calculated.

Unit a.u.

Shape [nTemperatures]

Thermodynamics%TS

Type float_array

Description T*S, i.e. temperature times entropy.

Unit a.u.

Shape [nTemperatures]

Vibrations Section content: Information related to molecular vibrations.

Vibrations%ExcitedStateLifetime

Type float

Description Raman excited state lifetime.

Unit hartree

Vibrations%ForceConstants

Type float_array

Description The force constants of the vibrations.

Unit hartree/bohr^2

Shape [nNormalModes]

Vibrations%Frequencies[cm-1]

Type float_array

Description The vibrational frequencies of the normal modes.

Unit cm^-1

Shape [nNormalModes]

Vibrations%Intensities[km/mol]

Type float_array

Description The intensity of the normal modes.

Unit km/mol

Shape [nNormalModes]

Vibrations%IrReps

Type lchar_string_array

Description Symmetry symbol of the normal mode.

Shape [nNormalModes]

Vibrations%ModesNorm2

Type float_array

Description Norms of the rigid motions.

Shape [nNormalModes+nRigidModes]

Vibrations%ModesNorm2*

Type float_array
Description Norms of the rigid motions (for a given irrep...?).
Shape [nNormalModes+nRigidModes]

Vibrations%nNormalModes

Type int
Description Number of normal modes.

Vibrations%NoWeightNormalMode (#)

Type float_array
Description ?.
Shape [3, Molecule%nAtoms]

Vibrations%NoWeightRigidMode (#)

Type float_array
Description ?
Shape [3, Molecule%nAtoms]

Vibrations%nRigidModes

Type int
Description Number of rigid modes.

Vibrations%nSemiRigidModes

Type int
Description Number of semi-rigid modes.

Vibrations%PVDOS

Type float_array
Description Partial vibrational density of states.
Values range [0.0, 1.0]
Shape [nNormalModes, Molecule%nAtoms]

Vibrations%RamanDepolRatioLin

Type float_array
Description Raman depol ratio (lin).
Shape [nNormalModes]

Vibrations%RamanDepolRatioNat

Type float_array
Description Raman depol ratio (nat).
Shape [nNormalModes]

Vibrations%RamanIncidentFreq

Type float
Description Raman incident light frequency.

Unit hartree

Vibrations%RamanIntens [A^4/amu]

Type float_array

Description Raman intensities

Unit A^4/amu

Shape [nNormalModes]

Vibrations%ReducedMasses

Type float_array

Description The reduced masses of the normal modes.

Unit a.u.

Values range [0, ‘infinity’]

Shape [nNormalModes]

Vibrations%RotationalStrength

Type float_array

Description The rotational strength of the normal modes.

Shape [nNormalModes]

Vibrations%TransformationMatrix

Type float_array

Description ?

Shape [3, Molecule%nAtoms, nNormalModes]

Vibrations%VROACIDBackward

Type float_array

Description VROA Circular Intensity Differential: Backward scattering.

Unit 10⁻³

Shape [nNormalModes]

Vibrations%VROACIDDePolarized

Type float_array

Description VROA Circular Intensity Differential: Depolarized scattering.

Unit 10⁻³

Shape [nNormalModes]

Vibrations%VROACIDForward

Type float_array

Description VROA Circular Intensity Differential: Forward scattering.

Unit 10⁻³

Shape [nNormalModes]

Vibrations%VROACIDPolarized

Type float_array

Description VROA Circular Intensity Differential: Polarized scattering.

Unit 10⁻³

Shape [nNormalModes]

Vibrations%VROADeltaBackward

Type float_array

Description VROA Intensity: Backward scattering.

Unit 10⁻³ A⁴/amu

Shape [nNormalModes]

Vibrations%VROADeltaDePolarized

Type float_array

Description VROA Intensity: Depolarized scattering.

Unit 10⁻³ A⁴/amu

Shape [nNormalModes]

Vibrations%VROADeltaForward

Type float_array

Description VROA Intensity: Forward scattering.

Unit 10⁻³ A⁴/amu

Shape [nNormalModes]

Vibrations%VROADeltaPolarized

Type float_array

Description VROA Intensity: Polarized scattering.

Unit 10⁻³ A⁴/amu

Shape [nNormalModes]

Vibrations%ZeroPointEnergy

Type float

Description Vibrational zero-point energy.

Unit hartree
